

Case 8 (June 2008):

Female, 16-30 yrs, not pregnant presenting with tiredness | depression | lack of energy | muscular pains | bloated.

As reported by patients husband: "Isabel indicated that Celiac Disease was one of the diagnoses and when the results came back the tests showed that she had Celiac disease. At the time it did not mean much to me but after the results came back I was amazed that no one had thought to consider this in all the seven or so years that she has had problems!!! She has always been diagnosed with Chronic Fatigue after having glandular fever but the symptoms never really went away. Apparently chronic fatigue can sometimes be a misdiagnosis of celiac disease..."

Over the past 10 days or more she has completely changed to a low GI and gluten free diet and seems to be a totally different and happier girl!"

FINAL DIAGNOSIS: Celiac disease

CBS SUNDAY MORNING
"Diagnostic errors are more common than people think"...
 "Every once in a while, I think it would be healthy for the patient to ask the doctor, "OK, you think it is disease X. Is there anything else this could possibly be?" May 2006
