

Case 2 (March 2010):

Female, 30-40 yrs, America North region, presenting with fever | myalgias | arthralgias | paresthesia | elevated sedimentation rate.

FINAL DIAGNOSIS: Lyme Disease. The patient had been seen by various Physicians in clinics and also in a hospital rheumatology department. The patient had a negative ELISA test and was deemed negative for Lyme disease due to this. A Physician sent off a Western blot test which was returned positive and confirmed the Lyme disease diagnosis. If Isabel PRO had been used when the patient presented the diagnosis of Lyme disease would have featured high on the differential list and the diagnosis may have been made earlier and without the need for referral to so many Physicians.
